

Dev Toolbox

A pocketful of everyday tools for Unity

21 TOOLS · ONE TIDY WINDOW

Made by Auxilium

Hello, and thanks

This is the little box of tools you did not know you were missing until the day you needed all of them at once. Twenty one small helpers for the fiddly bits of Unity, tucked into one friendly window so you never have to go hunting.

No setup, no dependencies, no ceremony. Import it, open the window, get on with your day.

The one thing to remember: everything lives in one place. Open it from `Window > Auxilium > Dev Toolbox` , or `Tools > Auxilium > Dev Toolbox` . That window is your home base. Each group folds away when you are not using it, so it stays tidy.

What you need

Unity 6.3 LTS or newer. That is the whole list. It works in any project, 2D or 3D, any pipeline.

Sixty seconds to your first win

- 1 Open `Window > Auxilium > Dev Toolbox` .
- 2 Find **Missing Script Remover** under Housekeeping and press Open.
- 3 Press **Scan And Clean Open Scenes**.
- 4 Watch those annoying broken script lines vanish. That is the vibe of the whole pack.

The whole toolbox

Twenty one tools, sorted into five groups. Every one opens from the toolbox window, and most also have a menu item under `Tools > Auxilium > Dev Toolbox`.

Housekeeping

Missing Script Remover

Clears the broken Missing Script lines left behind when a script or package is deleted. Cleans open scenes, your selection, or every prefab at once.

Clean Empty Folders

Sweeps out the empty folders that pile up as you move assets around. Shows you the list before it deletes a thing.

Scene and Play

Scene Quick Switch

Every scene in your project, one click to open. No more digging through the Project window.

Fullscreen Game View

Play edge to edge with the toolbar and taskbar hidden. Pick your own shortcut in the toolbox window. Escape always brings you back.

Time Scale

Slow play mode to a crawl to study a moment, or speed it up to skip ahead. A slider and some handy presets.

Camera Bookmarks

Save six Scene view viewpoints and fly back to them. The spots you keep returning to, one click away.

Objects and Level

Batch Rename

Rename a whole selection at once, with numbering or find and replace. Scene objects and project assets alike.

Align Objects

Line a selection up on any axis, or spread it out evenly. Tidy a row of props in a blink.

Randomize Transform

Scatter props with random rotation, scale and a little jitter, so a copied bush stops looking copied.

Replace With Prefab

Block out a level with cubes, then swap them all for the real art in one go, transforms kept.

Snap To Ground

Drop the selection onto the collider below it, optionally aligned to the surface. Shortcut **F8**.

Group Selected

Parent a selection under a fresh empty at its centre. Shortcut **Ctrl+Shift+G**.

Reset Transform

Zero the position and rotation, scale back to one. The little chore you do a hundred times a day.

Toggle Active

Show or hide the selection with a shortcut. **Ctrl+Shift+A**.

Copy and Paste Transform

Copy one object's world transform and stamp it onto others. Under the Transform submenu.

Media

Auxilium Screenshot

Capture the game view at high resolution, with hotkeys, formats, a timer, burst, and an optional watermark. Your press kit starts here.

Image Converter

Batch convert selected image files between JPEG and PNG, without leaving Unity.

Data and Notes

PlayerPrefs Editor

See, edit, add and delete your PlayerPrefs in a window, instead of writing throwaway code to peek at a value.

Project Notes

A scratch pad that travels with the project. Todos, reminders, handover notes, all saved alongside the repo.

Selection History

Step back and forward through what you have selected, like a browser. **Alt+Left** and **Alt+Right**.

Auto-Save

Saves your open scenes every few minutes, so a crash or a stray close never costs more than a moment. Set it and forget it.

Shortcuts at a glance

Fullscreen Game View **F9** by default, and yours to change in the toolbox window. Escape also exits.

Snap To Ground **F8**

Group Selected **Ctrl+Shift+G**

Toggle Active **Ctrl+Shift+A**

Selection Back and Forward **Alt+Left** and **Alt+Right**

Screenshot capture **F10** to **F12**, set inside the Screenshot window

A few good habits

Turn on **Auto-Save** the day you install this. Future you will send a thank you note.

Run **Missing Script Remover** before you hand a project to anyone. A clean project is a happy project.

Use **Camera Bookmarks** on a big level. Save the spawn, the boss room, the far corner, and stop flying across the map.

Randomize Transform plus **Snap To Ground** turns ten minutes of placing rocks into ten seconds.

If something is odd

A shortcut does nothing Another asset or Unity itself may already own that key. For Fullscreen, pick a different one in the toolbox window.

Camera Bookmarks will not move Click inside the Scene view once first, so it knows which view to fly. It moves the Scene view, not your Camera objects.

Snap To Ground does nothing The ground needs a collider for the drop to land on.

PlayerPrefs list is empty Listing reads the Windows registry. On Mac and Linux you can still add, edit and delete by key.

Stuck in fullscreen Press Escape. It always brings the editor and the taskbar back.

Say hello

Found a bug, want a tool added, or just getting on well? We would love to hear it, and a review on the Asset Store genuinely makes our week and keeps these coming.
