

Auxilium Screenshot

Beautiful captures, straight from Unity

HIGH RES · HOTKEYS · WATERMARK

Part of the Auxilium Dev Toolbox

Say cheese

Auxilium Screenshot grabs crisp, high resolution captures of your game the moment you want them, with hotkeys, a timer, burst mode, formats and an optional watermark. Your store images and press kit start right here, without ever leaving the editor.

Where to find it: open the Dev Toolbox window and press Open on the Screenshot card, or go to [Tools > Auxilium > Dev Toolbox > Screenshot > Capture Window](#) .

Your first shot in ten seconds

- 1 Open the Screenshot window.
- 2 Pick a **Quality**, such as UHD 4K, and a **Format**, PNG or JPEG.
- 3 Press the big **Capture** button, or your hotkey.
- 4 The image lands in your captures folder, ready to share.

Capture settings

	Quality	Pick a resolution preset like UHD 4K, or tick Custom Resolution to set your own exact width and height.
	Format	PNG for a lossless image, or JPEG with a quality slider for a smaller file.
	Capture Mode	Safe upscales from the game view for speed, or renders at the exact target size. See the note below.
	File Prefix	The name each file starts with. A number is added so shots never overwrite each other.
	Folder	Where captures are saved. Browse to any folder you like.
	Hide UI on Capture	Leaves your on screen UI out of the shot, for a clean scene grab.
	Include Post-Processing	Renders through the main camera so bloom, colour grading and the rest are baked into the image.
	Open After Capture	Pops the folder open the moment a shot is saved, so it is right there.
	Timer Delay	Waits a few seconds before firing, so you can pose the scene or hide the cursor first.
	Burst Count	Fires several shots in a row, handy for catching a fast moment.

Post-Processing note. With Include Post-Processing on, the shot renders via the main camera so your effects show up, and Capture Mode is ignored because the image is already taken at the exact target size.

Sound and hotkey

	Play Sound on Capture	A little shutter click when a shot fires. Drop in your own clip if you like.
	Hotkey	Bind capture to F10 , F11 or F12 so you never reach for the mouse mid action.
	Play Mode Only	Keeps the hotkey from firing while you are editing, so it only works when the game is running.

Watermark

Stamp a logo onto every capture, perfect for social posts and work in progress shots.

Texture

The logo or badge to place on the shot.

Corner

Which corner it sits in. Pick the one that stays out of the action.

Maintenance

Open Screenshots Folder

Jumps straight to where your captures live.

Clean Legacy Presets

Tidies up any leftover game view presets from earlier captures, so your game view list stays clean.

If something is odd

The hotkey does nothing

If Play Mode Only is on, it only fires while the game is running. Another tool may also own that key.

My effects are missing

Turn on Include Post-Processing so the shot renders through the main camera with your effects.

The shot is the wrong size

Check Quality, and Custom Resolution if you set your own. With post processing on, the exact target size is always used.
